VC-806

Description

Vectron's VC-806 Crystal Oscillator is a quartz stabilized, differential output oscillator, operating off either a 2.5 or 3.3 volt supply in a hermetically sealed 3.2x5 ceramic package.

Features

- Ultra Low Jitter Performance, Fundamental or 3rd OT Crystal Design
- Output Frequencies to 250MHz
- <0.7 ps RMS jitter, 12k-20MHz
- Differential Output
- Enable/Disable
- -10/70°C or -40/85°C Operation
- Hermetically Sealed 3.2x5 Ceramic Package
- Product is compliant to RoHS directive  and fully compatible with lead free assembly

Applications

- Storage Area Networking
- Telecom
- Ethernet, GE, SynchE
- Fiber Channel
- PON
- Driving A/D's, D/A's, FPGA's
- Test and Measurement
- Medical
- COTS

1. The VC-806 power supply pin should be filtered, eg, a 0.1 and 0.01uf capacitor.
2. See Standard Frequencies and Ordering Information for more information.
3. Includes calibration tolerance, operating temperature, supply voltage variations, aging and IR reflow.
4. Figure 2 defines these parameters and Figure 1 defines the test circuit.
5. Duty Cycle is defines as the On/Time Period.
6. Measured using an Agilent E5052, 156.25MHz.
7. Measured using a Wavecrest SIA3300C, 90K samples.
8. Outputs will be Enabled if Enable/Disable is left open.

LVPECL Application Diagrams

Figure 5 Standard PECL Output Configuration

Figure 6 Single Resistor Termination Scheme

Resistor values are typically 120 to 240 ohms for 3.3V operation.
Resistor values are typically 82 to 120 ohms for 2.5V operation.

Figure 7 Pull-Up Pull Down Termination

Resistor values are typically for 3.3V operation
For 2.5V operation, the resistor to ground is 62 ohms and the resistor to supply is 240 ohms

The VC-806 incorporates a standard PECL output scheme, which are un-terminated emitters as shown in Figure 5. There are numerous application notes on terminating and interfacing PECL logic and the two most common methods are a single resistor to ground, Figure 6, and a pull-up/pull-down scheme as shown in Figure 8. An AC coupling capacitor is optional, depending on the application and the input logic requirements of the next stage.

LVDS Application Diagrams

Figure 8 Standard LVDS Output Configuration

Figure 9 LVDS to LVDS Connection, Internal 100ohm
Some LVDS structures have an internal 100 ohm resistor on the input and do not need additional components.

Figure 10 LVDS to LVDS Connection External 100ohm and AC blocking caps
Some input structures may not have an internal 100 ohm resistor on the input and will need an external 100ohm resistor for impedance matching. Also, the input may have an internal DC bias which may not be compatible with LVDS levels, AC blocking capacitors can be used.

One of the most important considerations is terminating the Output and Complementary Outputs equally. An unused output should not be left un-terminated, and if one of the two outputs is left open it will result in excessive jitter on both. PC board layout must take this and 50 ohm impedance matching into account. Load matching and power supply noise are the main contributors to jitter related problems.

Environmental and IR Compliance

IR Compliance

Suggested IR Profile

Devices are built using lead free epoxy and can be subjected to standard lead free IR reflow conditions shown in Table 5. Contact pads are gold over nickel and lower maximum temperatures can also be used, such as 220C.

Parameter	Symbol	Value
PreHeat Time	t_s	200 sec Max
Ramp Up	R_{UP}	3°C/sec Max
Time above 217°C	t_L	150 sec Max
Time to Peak Temperature	t_{AMB-P}	480 sec Max
Time at 260°C	t_P	10 sec Max
Time at 240°C	t_{P2}	60 sec Max
Ramp down	R_{DN}	6°C/sec Max

Maximum Ratings, Tape & Reel

Absolute Maximum Ratings and Handling Precautions

Stresses in excess of the absolute maximum ratings can permanently damage the device. Functional operation is not implied or any other excess of conditions represented in the operational sections of this data sheet. Exposure to absolute maximum ratings for extended periods may adversely affect device reliability.

Although ESD protection circuitry has been designed into the VC-806, proper precautions should be taken when handling and mounting, VI employs a Human Body Model and Charged Device Model for ESD susceptibility testing and design evaluation.

ESD thresholds are dependent on the circuit parameters used to define the model. Although no industry standard has been adopted for the CDM a standard resistance of 1.5kOhms and capacitance of 100pF is widely used and therefor can be used for comparison purposes.

Parameter	Symbol	Rating	Unit
Storage Temperature	T_{STORE}	-55/125	°C
Supply Voltage	V_{DD}	-0.5 to 5.0	V
Enable Disable Voltage		-0.5 to $V_{DD}+0.5$	
ESD, Human Body Model		1000	V
ESD, Charged Device Model		1000	V
